

STATS FOR
GENDER.ORG

The height of teenagers taking puberty blockers did not increase at an age-appropriate rate.

In a prospective study [1] of patients aged 12-15 referred to University College Hospital, London by the Gender Identity Development Service, patients on puberty blockers did grow taller, but not by as much as others in their age group.

This study is compromised by the lack of follow-up once patients reached the age of 16, meaning there were significant effective drop-out rates at 24 and 36 months.
